

# COMPOUNDING ISOLATOR

The EnGuard compounding isolator provides safe containment and eliminates cross contamination. These isolators are designed primarily for small volume processes including laboratory testing and clinical trial investigations.

EnGuard compounding isolators are single chambers with ergonomic glove port access to areas where operator intervention is required. Process equipment can be removed using a sliding platform which makes maintenance, major changeovers and cleaning all much easier. These isolators can, in some instances, accommodate more than one piece of equipment when the ergonomics and equipment configurations allow.
